

Cedar Basics

cedar

There are a number of files that you need to know about to understand how Cedar will behave when it runs on your machine; these include your user profile, the catalogue of registered commands and the basic DF files that provide the common components of the system (like the compiler, binder, the Viewers package, etc.). Also below are references to the latest release message and how to boot a

Basic DF files

CedarClient.df is the collection of the basic Cedar components; you will find it useful as a roadmap for all of the other DF files that are used in Cedar. CedarClientFat.df includes more components and also the sources for a number of the important interfaces (bringover /a CedarClient.df will only bringover the .bcd files for the interfaces, which makes it hard to start building programs although you can compile them.)

Handy tools

To read mail, edit documents and print things (the references to documentation are on the

Dorado booting

One of the handy things to know about (even if you're using a public machine) is some of the magic behind Dorado booting -- here's the scoop (in
