

This protocol is currently implemented by IFS file servers running version 1.36.4 or newer of the IFS software.

The IFS implementation requires that the LookupFileRequest contain a complete IFS filename in the form <directory>subdirectories>..>name!version'', except that the version may be one of the special version designators ( !H'' or !L''), or may be omitted altogether in which case "!H" is assumed. Patterns containing '\*'' are not permitted.

The error codes returned by IFS LookupFile servers are IFS internal error codes, whose interpretation may be found in file <System>IFS.errors on that server.
